Hydraulic fracturing is a technique frequently used to stimulate the production of an oil or gas well by creating a fracture in the porous rock around the wellbore. The success of a hydraulic fracture treatment depends heavily on the created fracture geometry. The optimum situation arises when a

In this case, wellbore pressure reaches the value of  $p_{\text{wellbore}} = 76 \text{ MPa}$ , and the fracture opening at the wellbore is only  $W_{\text{wellbore}} = 0.2 \text{ mm}$ . Download full-size image Fig. 5 .

The near-wellbore fracture geometry is then determined. The effects of this fracture geometry on fracture execution and production are discussed. Critical fracturing pressures are also calculated for different wellbore orientations and in-situ principal stress magnitudes. Guidelines are provided to enhance the success of fracturing treatments.
